

Integrating spatial processes into ecosystem models for sustainable utilization of fish resources INSPIRE

Deliverable No: 6.2			Workpackage: 6		
Date:	31.10.2016	6 Contract delivery due date Oc		October 20	016
Title:	Training School Report				
Lead Partner for Deliverable	DTU-Aqua				
Author(s):	Stefan Neuenfeldt, Brian MacKenzie				
Dissemination level (PU=public, PP=Restricted to other programme participants, PU including the BONUS Secretariat, CO=confidential)					
Report Status (DR = Draft, FI = FINAL)					FI

Acknowledgements

The research leading to these results has received funding from BONUS, the joint Baltic Sea research and development programme (Art 185), funded jointly from the European Union's Seventh Programme for research, technological development and demonstration and from national funding institutions

INSPIRE Overview

Process-based understanding of changes in commercial fish spatial distributions, and to disentangle the role of natural drivers and various anthropogenic impacts, is a challenging research topic with high relevance to resource management. The very recently started four-years BONUS INSPIRE project will fill in the most persistent gaps in knowledge of the spatial ecolology of the major commercial fish and thereby support the effectiveness of the relevant policies and ecosystem-based management of the Baltic Sea. The project would serve as a "framework axis project" which other Baltic Sea research could be related to.

INSPIRE is designed to substantially advance our knowledge on the major commercial fish species – cod, herring, sprat and flounder, which represent key elements of the Baltic Sea ecosystems. The specific objectives of INSPIRE are to:

- i. Quantify processes generating heterogeneity in spatial distributions of fish;
- ii. Quantify and map potential hazards to the connectivity between identified key habitats, and assess the impact of anthropogenic and climatic environmental changes on habitat connectivity;
- iii. Quantify the population dynamics and interactions of the fish species in a spatially explicit context;
- iv. Develop spatially explicit advice for ecosystem-based fisheries management.

INSPIRE proposes pilot ecosystem integrated surveys to resolve the habitat requirements of different life-stages of fish species by combined use of traditional methods and application of modern advanced analysis techniques. The surveys are conducted in close collaboration with local fishermen.

Executive Summary:

The BONUS BIO-C3/INSPIRE/COCOA/BAMBI 2016 Summer School ran from August 22-26 at Søminestation, near Holbæk, Denmark. The course consisted of a mix of lectures, hands-on statistical analyses/ modelling exercises. Ten lecturers and 23 students participated in the summer school. We also asked the students to do a 22-question survey evaluation about the course on the final afternoon before we ended. The results are attached and were overall very positive. Most satisfying is that the vast majority of the students learned a lot, and found the course motivating and stimulating.

Modelling Biodiversity for Sustainable Use of Baltic Sea Living Resources

The setting was near-perfect: a former naval research station converted to a modern dormitory-style teaching facility located on the shore of a quiet Danish estuary with sunny, warm weather most of the week.

One of the main purposes of the summer school was to educate and train a new generation of young scientists on the challenges and opportunities that face biodiversity in the Baltic Sea and provide them with new knowledge and quantitative tools on how to model its variations and their consequences.

The course consisted of a mix of lectures, hands-on statistical analyses/ modelling exercises and discussions addressing both functional and taxonomic aspects of marine biodiversity, with emphasis on estuarine systems, using the Baltic Sea as a case study. Students learned new modelling approaches and softwares which they could take home and apply to their own research projects. And thanks to the participation of 23 students (16 women, 7 men) and 10 lecturers (4 women, 6 men), they now have expanded and developed a network of colleagues that they can interact and collaborate with in future. The students came from both Baltic and non-Baltic countries, were mostly Ph.d. students (18), with some postdoctoral scientists (4) and Masters graduates (1).

Topics covered in the course included time-space variation of biodiversity, including both functional and taxonomic perspectives at different levels of biological organisation (populations, species, communities). The course also reviewed and identified how different drivers (e. g., fishing, eutrophication, climate change, invasive species) affect biodiversity and how biodiversity levels and variations feed back to the drivers and ecosystem management policy developments. Students then had the opportunity to synthesize their new knowledge on interactions and feedbacks between biodiversity and management by working in small groups to make a short (1000 words) report and 10 minute oral presentation on this topic on the final day – a task which demanded their attention during evenings and the last day!

The students did a great job with the task, especially given the time constraints and the challenge to form cohesive work groups with people having different backgrounds and that they had not met before. Aside from the work tasks, there was time for socialising, networking, running in the nearby forest or swimming in the fjord.

Core elements of the summer school included:

- 1. Biodiversity dynamics in time and space (patterns of variation)
- 2. Drivers of biodiversity dynamics ("why does biodiversity vary?")
- 3. Descriptors of biodiversity taxonomic and functional perspectives (e. g., traits)
- 4. Consequences of variations in biodiversity effects on populations, species, food webs, "ecosystem goods and services"
- 5. Tools for quantifying biodiversity dynamics

Learning objectives:

- 1. Learn ways to model variations in biodiversity due to both natural and anthropogenic drivers.
- 2. Demonstrate how variations in biodiversity affect species interactions in foodwebs
- 3. and the provision of ecosystem services and products.

- 4. Quantify how natural and human functional descriptors of biodiversity for major taxonomic groups in the Baltic Sea (e. g., fish, benthos, plankton).
- 5. Learn the key Baltic and European biodiversity policy and governance frameworks, and how supporting data can be collected and applied.
- 6. Learn sources of data for analysing variations in biodiversity in the Baltic Sea.

Participants:

	Name	Affiliation	Country
1	Laura Briekmane	University of Latvia	Latvia
2	Joanna Całkiewicz	University of Gdańsk	Poland
3	David Costalago	Stockholm University	Sweden

Evaluation: Modelling Biodiversity for Sustainable Use of Baltic Sea Living Resources

To answer simply check the dot beside each statement that most accurately reflects your view.

5means that you definitely agree
4means that you agree, but with reservations
3means that you are neutral
2means that you tend to disagree
1means that you definitely disagree

Please answer all the questions.

25 could answer this evaluation schema. 23 have answered this evaluation schema. The answer percentage is 92.00%.: 23 / 25

1.19 The teacher has put a lot of time into commenting (orally and/or in writing) on my work

1.20 In this course it was made clear right from the start what was expected from me

1.21 The teacher worked hard to make the subject of this course interesting

1.22 The volume of work necessary to complete this course means that it cannot all be thoroughly comprehended
